## UMSAEP UM/UWC Linkage Program: Final Report

# "Curriculum Development in Materials Science at UWC"

Carsten A. Ullrich
Department of Physics and Astronomy, University of Missouri, Columbia, MO 65211

This final report summarizes the activities and outcomes of my visit to South Africa, sponsored by a \$1,500 UMSAEP grant he visit took place from April 1 to May 4, 2017, together with Prof. Suchi Guha from MU Physics. Our hosts were Profs. Chris Arendse, Theophilus Muller, and Dirk Knoesen from the UWC Physics department.

#### I. Teaching activities

During the first two weeks of this vis(April 3-14, before the Easter break) taught two short courses the BSc and MS level, respectively.

#### I.1 Electronic structure and excitations in nanomaterials (MSnanophysics)

The Master of Science (MSc) twycear degree in Nanoscience, a unique program in South Africa, is collaborative initiative betweed/WC, University of Johannesburg (UJ), University of the Free State (UFS), the Nelson Mandela Metropolitan University (NMMU) and the Department of Science and Technology. It is spearheaded by UWC (and coordinated by Prof. Dirk Knoesen). The partnership between these institutions allows students from other campuses across South Africa to take courses at UWC. This year has been one of the largest enrollments in their MSc Nanoscience program: the course was taken by 11 studentsbout half of these were from UWC.

Prof. Suchi Guha and I team taught thosurse on Electronic Structure and Excitations in Nanomaterials" overtwo weeks. The course was offered evoluty for two hours in the afternoon (on two days there was no class, due to a holiday and due to graduation)

The aim of this surveystyle course was toprovide students with anappreciation and understanding of the

## Day 1:

- x Review of quantum mechanics;
- x Atomic structure
- x Interatomic binding I and II
- x Crystal structure I

## Day 2:

- x Crystal structure II
- x Reciprocal lattice
- x Quantized electron gas

## Day 3:

Χ

#### II. Other activities

During our stay at UWC, Prof. Guha and I had the opportunity to visit **odise** arch facilities: The iThemba LABS in Cape Town and NMMU in Port Elizabeth. Research activities at the IThemba LABS are based on subtomic particle accelerators. It also has a strong focus on materials science related research. We got an-idepth tour of their research facilities.

The visit to NNMU in Port Elizabeth was organized by Prof. Arendse and the Nanoscience program. The electron microscopy facility at NNMU is a wearlasts research facility and is equipped with stateof-the-art electron microscopes. We are grateful to Prof. Jan Neethling (Director of the high resolution microscopy center) and other faculty members of the physics department at NNMU for discussing their research activities and giving us a tour of their workers research capatibles.

My own research is in theoretical and computational condemnater physics. Therefore, learning about ongoing experimental research at UWC, IThemba and NNMU was very interesting for me, even though it did not lead to any concrete scientific ptsjer collaboratins, at least not at this time.

I made the observation that there is a notable absence of theoretical comdettee physics at UWC or, for that matter, in most of South Africa. The UWC physics department is very strong in nuclear physics and astrophysics, including theory, but there are no theorists to lend supplementaterials science program, or to train their students. I believe that this would offer opportunities for future visits to UWC, either to teach or to collaborate. I wo
